Heroku Deployment Guide: Flask + Iris ML Model

1. Prerequisites

- Python installed
- Git installed
- Heroku CLI installed (<https://devcenter.heroku.com/articles/heroku-cli#download-and-install>)
- A Heroku account

2. Project Folder Structure

- app.py
- iris_model.pkl
- requirements.txt
- Procfile (no extension)
- templates/index.html

3. Initialize Git Repository

- git init
- git add .
- git commit -m "Initial commit"

4. Create requirements.txt -

pip freeze > requirements.txt

- Or manually add:

Flask numpy

scikit-learn

joblib

gunicorn

5. Create Procfile

- File name: Procfile (no extension)

- Contents: web: gunicorn app:app

6. Heroku Commands

- heroku login

- heroku create iris-flask-ml-app

- git push heroku main (or master)

- heroku open

7. Test the API

- Use Postman or curl:

- curl -X POST https://iris-flask-ml-app.herokuapp.com/api \

-H "Content-Type: application/json" \

-d '{"features": [5.1, 3.5, 1.4, 0.2]}'

8. Final Checklist

- App running on Heroku

- Web form works

- API works with POST JSON

- Code and documentation uploaded to GitHub
